

DANA Integration — Fund Flow

AYO subscription code sales and agent commission payouts. Prepared 27 August 2026.

Scope

DANA is used for two things only: collecting payment for SellMore subscription codes, and paying commission to L1 and L2 sales agents. AYO does not process payments on behalf of SellMore merchants and does not touch merchant transaction money.

Fund flow

Instant	Customer pays for subscription code Gapura Payment Gateway, hosted checkout. DANA confirms to AYO by webhook. DANA holds the funds
T+X, X ≥ 1	Merchant Settlement Account Daily cut-off at 00:00. DANA issues a settlement CSV per day. Automatic daily transfer, destination fixed at onboarding
Daily	Company bank account Registered as the settlement account during business verification. Not optional. Manual step. Finance transfers to the Virtual Account shown in Merchant Portal
Manual	Merchant Disbursement Account (MDA) Separate balance. Funded only by Virtual Account top-up. This is the pool payouts draw from. Customer Top Up API, one call per agent
Instant	Agent's DANA balance Agent identified by registered phone number. No bank account details needed.

Can the bank account be removed?

No, not on the published DANA documentation. Three separate facts make it structural:

- A settlement bank account is a **mandatory field** during business verification, before the account is approved.
- Gapura proceeds are swept to that bank account automatically at the end of each day. There is no setting to redirect them.
- The MDA is documented as funded one way only: “top up via the Virtual Account displayed in Merchant Portal”.

DANA's own balance API treats them as different pots — it exposes MERCHANT_TOTAL_BALANCE (settlement side) and MERCHANT_DEPOSIT_BALANCE (disbursement side) as separate values. Nothing in the API moves money between them.

This is a documentation limit, not necessarily a product limit. Netting or auto-sweep between settlement and disbursement may exist as a commercial arrangement. It is a question for the DANA account manager, not something that can be built.

Consequences to plan for

Issue	Impact
Working capital float	Payouts run weekly (Wednesday) and monthly (5th). Settlement is T+X, so money from a sale is not available on payout day. The MDA must be funded ahead of each run.
Manual top-up is a dependency	If finance does not top up before a payout cron fires, the batch fails part-way. AYO should check MDA balance first and refuse to start rather than pay some agents and not others.
Money passes through the company account	Unavoidable. It also means normal bookkeeping and tax treatment apply to the full gross, not the net after commission.
Two reconciliation sources	Gapura settlement CSV (money in) and disbursement settlement CSV (money out) are separate daily files and must be reconciled independently.
Per-agent monthly caps	A DANA account has a monthly incoming top-up limit. High-earning agents can hit it. Validate the agent account before each transfer, not after.
Timeouts are not failures	A timed-out transfer must be held as pending and re-checked, never retried blind. Treating it as failed risks paying an agent twice.

Questions for DANA

1	Can Gapura settlement be directed to the Merchant Disbursement Account instead of a bank account, or netted against it?
2	What is the lowest available settlement cycle — is T+1 offered on our tier?
3	What is the monthly incoming limit on a recipient DANA account, and can it be raised for our agents?
4	What is the aggregate daily disbursement cap on our merchant configuration?
5	What are the fees on each leg — Gapura acquiring and disbursement top-up?

Prerequisites before build

Item	Status
DANA Enterprise account	Business verification. Approval takes up to 2 business days after documents are complete.
Products selected	Gapura Payment Gateway <i>and</i> Disbursement to Balance. Both must be requested; they are activated separately.
Credentials	Partner ID, client secret, merchant RSA key pair, DANA public key for webhook verification.
Sandbox	DANA tops up the sandbox MDA on request. Scenario testing is required before go-live.
